

#### Driver LC 75W 100–400mA 220V po4a NFC h16 PRE3

D4i premium NFC series

#### Product description

- NEW: lumDATA (DALI-2 part ext. 251, 252 and 253)
- Dimmable built-in constant current LED driver
- Dimming range 1 – 100 %
- For luminaires of protection class I and protection class II
- Adjustable output current between 100 and 400 mA
- Max. output power 75 W
- Up to 91 % efficiency
- Power input on stand-by < 0.2 W
- Nominal lifetime up to 100,000 h
- 5 years guarantee (conditions at [www.tridonic.com](http://www.tridonic.com))

#### Housing properties

- Low profile metal casing with white cover
- Only 16 mm housing height
- Type of protection IP20

#### Interfaces

- Near field communication (NFC)
- one4all (DALI-2 DT 6, DSI, switchDIM, corridorFUNCTION)
- ready2mains™ (configuration and dimming via mains)
- Terminal blocks: 0° push terminals

#### Functions

- Adjustable output current in 1-mA-steps (NFC, DALI, ready2mains™) or with resistor plug (I-SELECT 2)
- Fulfills DALI-2 parts: 250 (Integrated bus power supply), 251 (Luminaire data), 252 (Energy reporting) and 253 (Diagnostics & Maintenance)
- Constant light output function (CLO)
- Power-up fading at AC
- Configurable via ready2mains™
- Switch off the Driver with fade2zero
- Protective features (overtemperature, short-circuit, overload, no-load, input voltage range, reduced surge amplification)
- Suitable for emergency escape lighting systems acc. to EN 50172

#### Benefits

- Flexible configuration via companionSUITE
- Application-oriented operating window for maximum compatibility
- Best energy savings due to low stand-by losses and high efficiency

#### Typical applications

- For linear/area lighting in office applications

**Standards**, page 5

#### Driver LC 75W 100–400mA 220V po4a NFC h16 PRE3

D4i premium NFC series

#### Technical data

Rated supply voltage	220 – 240 V
AC voltage range	198 – 264 V
DC voltage range	176 – 280 V
Mains frequency	0 / 50 / 60 Hz
Overvoltage protection	320 V AC, 48 h
Typ. current (at 230 V, 50 Hz, full load)① ②	361 mA
Typ. current (220 V, 0 Hz, full load, 15 % dimming level)② 76 mA	
Leakage current	< 330 µA
Max. input power	82 W
Typ. efficiency (at 230 V / 50 Hz / full load)②	91 %
λ (at 230 V, 50 Hz, full load)①	0.99
Typ. power consumption on stand-by③	< 0.2 W
Typ. input current in no-load operation	15 mA
Typ. input power in no-load operation	0.57 W
In-rush current (peak / duration)	24.7 A / 175 µs
THD (at 230 V, 50 Hz, full load)①	< 5 %
Starting time (AC mode)	< 0.6 s
Starting time (DC mode)	< 0.3 s
Switchover time (AC/DC)②	< 0.3 s
Turn off time (at 230 V, 50 Hz, full load)	< 17 ms
Output current tolerance①	± 3 %
Max. output current peak (non-repetitive)	≤ output current + 15 %
Output LF current ripple (< 120 Hz)	± 4 %
Output $P_{ST}^{LM}$ (at full load)	≤ 1
Output SVM (at full load)	≤ 0.4
Max. output voltage (no-load voltage)	250 V
Dimming range	1 – 100 %
Mains surge capability (between L – N)	1 kV
Mains surge capability (between L/N – PE)	2 kV
Surge voltage at output side (against PE)	< 500 V
Type of protection	IP20
Lifetime	up to 100,000 h
Guarantee (conditions at www.tridonic.com)	5 years
Dimensions L x W x H	360 x 30 x 16.3 mm

#### Ordering data

	325 mA	110 V	220 V	71.5 W	77.8 W	341 mA	80 °C	-25 ... +50 °C	15.38 kΩ
	350 mA	110 V	214 V	74.9 W	81.4 W	357 mA	80 °C	-25 ... +50 °C	14.29 kΩ
	375 mA	110 V	200 V	75.0 W	81.9 W	359 mA	80 °C	-25 ... +50 °C	13.33 kΩ
	400 mA	110 V	188 V	75.0 W	82.2 W	360 mA	80 °C	-25 ... +50 °C	short circuit (0 Ω)

<sup>①</sup> Valid at 100 % dimming level. Output current is mean value.

<sup>②</sup> Depending on the selected output current.

<sup>③</sup> Depending on the DALI traffic at the interface. DALI bus power supply deactivated.

<sup>④</sup> The table only lists a number of possible operating points but does not cover each single point. The output current can be set within the total value range in 1-mA-steps. Output current is mean value.

<sup>⑤</sup> Not compatible with I-SELECT (generation 1). Calculated resistor value.

<sup>⑥</sup> Valid for immediate change of power supply type otherwise the starting time is valid.

## I-SELECT 2 PLUG PRE / EXC

## Product description

- Ready-for-use resistor to set output current value
- Compatible with LED driver featuring I-SELECT 2 interface; not compatible with I-SELECT (generation 1)
- Resistor is base insulated
- Resistor power 0.25 W
- Current tolerance  $\pm 2\%$  to nominal current value
- Compatible with LED driver series PRE and EXC

## Example of calculation

- $R [k\Omega] = 5 V / I_{out} [mA] \times 1000$
- E96 resistor value used
- Resistor value tolerance  $\leq 1\%$ ; resistor power  $\geq 0.1 W$ ; base insulation necessary
- When using a resistor value beyond the specified range, the output current will automatically be set to the minimum value (resistor value too big), respectively to the maximum value (resistor value too small)

## Ordering data

## 1. Standards

EN 55015  
 EN 61000-3-2  
 EN 61000-3-3  
 EN 61347-1  
 EN 61347-2-13  
 EN 62384  
 EN 61547  
 EN 62386-101 (DALI-2)  
 EN 62386-102 (DALI-2)  
 EN 62386-207 (DALI-2, including part 250, 251, 252, 253)  
 According to EN 50172 for use in central battery systems  
 According to EN 60598-2-22 suitable for emergency lighting installations

## 2. Thermal details and lifetime

### 2.1 Expected lifetime

Expected lifetime						
Type	Output current	ta	35 °C	40 °C	45 °C	50 °C
LC 75/100-400/220 po4a NF h16 PRE3	100 mA	tc	60 °C	65 °C	70 °C	75 °C
		Lifetime	> 100,000 h	> 100,000 h	90,000 h	70,000 h
	> 100 – 200 mA	tc	60 °C	65 °C	70 °C	75 °C
		Lifetime	> 100,000 h	> 100,000 h	90,000 h	65,000 h
	> 200 – 300 mA	tc	65 °C	70 °C	75 °C	80 °C
		Lifetime	> 100,000 h	95,000 h	70,000 h	50,000 h
	> 300 – 400 mA	tc	65 °C	70 °C	75 °C	80 °C
		Lifetime	> 100,000 h	85,000 h	65,000 h	50,000 h

The LED driver is designed for a lifetime stated above under reference conditions and with a failure probability of less than 10 %.

The relation of tc to ta temperature depends also on the luminaire design.

If the measured tc temperature is approx. 5 K below tc max., ta temperature should be checked and eventually critical components (e.g. ELCAP) measured. Detailed information on request.

## 3. Installation / wiring

### 3.1 Circuit diagram

### 3.2 Wiring type and cross section

For wiring use solid wire from 0.5 – 1.5 mm<sup>2</sup>.

Strip 8 – 9 mm of insulation from the cables to ensure perfect operation of terminals.

LED module/LED driver/supply

### 3.3 Loose wiring

The voltage line for switchDIM / corridorFUNCTION must be the same line as on the mains input of the Driver. In switchDIM applications the DALI interface as well as the integrated DALI bus power supply (IPS) can not be used.

### 3.4 Wiring guidelines

- Run the secondary lines separately from the mains connections and lines to achieve good EMC performance.
- The max. secondary cable length is 2 m (4 m circuit), this applies for LED output as well as for I-SELECT 2.
- For good EMC performance, keep the LED wiring as short as possible.
- Secondary switching is not permitted.
- The LED driver has no inverse-polarity protection on the secondary side. Wrong polarity can damage LED modules with no inverse-polarity protection.
- Wrong wiring of the LED driver can lead to malfunction or irreparable damage.
- To avoid the damage of the Driver, the wiring must be protected against short circuits to earth (sharp edged metal parts, metal cable clips, louver, etc.).

### 3.5 Hot plug-in

Hot plug-in is not supported due to residual output voltage of  $> 0$  V.

When connecting an LED load, restart the device to activate the LED output.

This can be done via mains reset or via interface (DALI, DSI, switchDIM, ready2mains).

### 3.6 Earth connection

The earth connection is conducted as protection earth (PE). The LED driver can be earthed via earth terminal or metal housing. If the LED driver will be earthed, protection earth (PE) has to be used. There is no earth connection required for the functionality of the LED driver. Earth connection is recommended to improve following behaviour.

- Electromagnetic interferences (EMI)
- LED glowing at stand-by
- Transmission of mains transients to the LED output

In general it is recommended to earth the LED driver if the LED module is mounted on earthed luminaire parts respectively heat sinks and thereby representing a high capacity against earth.

### 3.7 External I-SELECT 2 resistors on LED modules

LED modules with on-board I-SELECT 2 resistors may cause irreparable damages, caused by surge / burst peaks.

## 4. Electrical values

### 4.1 Operating window

Make sure that the LED driver is operated within the given window under all operating conditions. Special attention needs to be paid at dimming and DC emergency operation as the forward voltage of the connected LED modules varies with the dimming level, due to the implemented amplitude dimming technology. Coming below the specified minimum output voltage of the LED driver may cause the device to shut-down. See chapter "6.8 DC operation" for more information.

### 4.4 THD vs load

100 % load corresponds to the max. output power (full load) according to the table on page 2.

### 4.2 Efficiency vs load

DALI bus power supply deactivated.

### 4.3 Power factor vs load

#### 4.5 Maximum loading of automatic circuit breakers in relation to inrush current

Automatic circuit breaker type	C10	C13	C16	C20	B10	B13	B16	B20	Inrush current	
Installation Ø	1.5 mm <sup>2</sup>	1.5 mm <sup>2</sup>	2.5 mm <sup>2</sup>	2.5 mm <sup>2</sup>	1.5 mm <sup>2</sup>	1.5 mm <sup>2</sup>	2.5 mm <sup>2</sup>	2.5 mm <sup>2</sup>	I <sub>max</sub>	time
<b>LC 75/100-400/220 po4a NF h16 PRE3</b>	21	28	35	43	13	17	21	26	24.7 A	175 µs

These are max. values calculated out of inrush current! Please consider not to exceed the maximum rated continuous current of the circuit breaker.

Calculation uses typical values from ABB series S200 as a reference.

Actual values may differ due to used circuit breaker types and installation environment.

#### 4.6 Harmonic distortion in the mains supply (at 230 V / 50 Hz and full load) in %

	THD	3.	5.	7.	9.	11.
<b>LC 75/100-400/220 po4a NF h16 PRE3</b>	< 6	< 4	< 2	< 2	< 1	< 1

#### 4.7 Dimming

Dimming range 1 % to 100 %

Digital control with:

- DSI signal:  
8 bit Manchester Code Speed 1 % to 100 % in 1.4 s
  - DALI signal:  
16 bit Manchester Code Speed 1 % to 100 % in 0.2 s
- Programmable parameter:  
Minimum dimming level Maximum dimming level Default minimum = 1 %  
Programmable range 1 % ≤ MIN ≤ 100 % Default maximum = 100 %  
Programmable range 100 % ≥ MAX ≥ 1 %

Dimming curve is adapted to the eye sensitiveness.

Dimming is realized by amplitude dimming.

#### 4.8 Dimming characteristics

Digital dimming value

Dimming characteristics as seen by the human eye

## 5. Software / Programming / Interfaces

### 5.1 Software / programming

With appropriate software and interface different functions can be activated and various parameters can be configured in the LED driver. The Driver supports the following software and interfaces:

Software / hardware for configuration:

- companionSUITE (deviceGENERATOR, deviceCONFIGURATOR, deviceANALYSER)
- masterCONFIGURATOR
- ready2mains Programmer

Interfaces for data transfer:

- NFC
- Control input DALI
- Control input ready2mains

### 5.2 Nearfield communication (NFC)

The NFC Interface allows wireless communication with the LED driver. This interface offers the option to write configuration and to read configuration, errors and events with the companionSUITE. A correct communication between the LED driver and the NFC antenna can only be guaranteed if the antenna is placed directly on the Driver. Any material placed between the LED driver and the NFC antenna can cause a deterioration of the communication quality. After programming the device via NFC power up the device one time for one second till the deviceANALYSER can read out the parameters. We recommend the use of following NFC antenna:  
[www.tridonic.com/nfc-readers](http://www.tridonic.com/nfc-readers)

NFC is complied with ISO/IEC 15963 standard.

### 5.3 Control input DALI

The control input is non-polar for digital control signals (DALI). The control signal is not SELV. The control cable has to be installed in accordance to the requirements of low voltage installations.

Digital control with:

- DALI signal: 16 bit
- DSI signal: 8 bit

### 5.4 Control input ready2mains (L, N)

The digital ready2mains protocol is modulated onto the mains signal which is wired to the mains terminal (L and N).

The configuration is done via the ready2mains Programmer, either directly at the Programmer itself or via a respective software tool. For details on the configuration via ready2mains see the technical information of the Programmer and its tools.

Following tools can be used:

- deviceCONFIGURATOR (companionSUITE)
- masterCONFIGURATOR
- ready2mains Programmer

### 5.5 I-SELECT 2

By inserting a suitable resistor into the I-SELECT 2 interface, the current value can be adjusted. The relationship between output current and resistor value can be found in the chapter "Accessories I-SELECT 2 Plugs". If the resistor is connected by wires a consistent base insulation must be ensured. Furthermore, a max. wire length of 2 m may not be exceeded and potential interferences have to be avoided.

Resistors for the main output current values can be ordered from Tridonic (see accessories).

## 6. Functions

⦿ companionSUITE:

DALI-USB, ready2mains Programmer, NFC

The companionSUITE with deviceGENERATOR, deviceCONFIGURATOR and deviceANALYSER is available via our WEB page:

<https://www.tridonic.com/com/en/products/companionsuite.asp>

⬠ masterCONFIGURATOR:

DALI-USB, ready2mains Programmer (in DALI mode)

The masterCONFIGURATOR is available via our WEB page:

<https://www.tridonic.com/com/en/software-masterconfigurator.asp>

### 6.1 OEM Identification

The OEM (Original Equipment Manufacturer) can set his own identification number.

DALI Part 251: Memory bank 1 extension.

### 6.2 OEM GTIN

The Original Equipment Manufacturer (OEM) can set his own Global Trade Item Number (GTIN).

DALI Part 251: Memory bank 1 extension.

### 6.3 Luminaire data

This function provides the asset management with accurate data about the luminaire.

DALI Part 251: Memory bank 1 extension.

### 6.4 LED current

The LED output current must be adapted to the connected LED module. The value is limited by the current range of the respective device.

The output current of the LED driver can be adjusted in a certain range. For adjustment there are 4 options available.

Option 1: DALI

Adjustment is done by companionSUITE or by masterCONFIGURATOR.

Option 2: NFC

Adjustment is done by companionSUITE via NFC.

Option 3: I-SELECT 2

By inserting a suitable resistor into the I-SELECT 2 interface, the current value can be adjusted.

Option 4: ready2mains

Adjustment is done by the ready2mains programmer and the corresponding configuration software (see ready2mains documentation).

The priority for current adjustment methods is NFC / DALI (highest priority), I-SELECT 2 and ready2mains (lowest priority).

### 6.4 Device operating mode

A Tridonic Driver supports several control signals.

These control signals are automatically detected and the mode is adapted.

If only one special device mode is required, this mode can be selected.

“Automatic detection” is the default setting.

### 6.5 switchDIM

In switchDIM applications the DALI interface as well as the integrated DALI bus power supply (IPS) can not be used.

Only in switchDIM applications DALI drivers with integrated DALI bus power supply (po4a) cannot be combined with standard DALI drivers (o4a).

The voltage line for switchDIM must be the same line as on the mains input of the driver.

Integrated switchDIM function allows a direct connection of a pushbutton for dimming and switching.

Brief push (< 0.6 s) switches LED driver ON and OFF.

The dimm level is saved at power-down and restored at power-up.

When the pushbutton is held, LED modules are dimmed.

After repush the LED modules are dimmed in the opposite direction.

In installations with LED drivers with different dimming levels or opposite dimming directions (e.g. after a system extension), all LED drivers can be synchronized to 50 % dimming level by a 10 s push.

Use of pushbutton with indicator lamp is not permitted.

### 6.6 corridorFUNCTION

With the corridorFUNCTION and a commercially available motion detector, it is easy to adapt the lighting in one area to its use.

That is, when the area is entered by a person, the lighting dims instantly to the desired brightness and is available in full strength.

After the area is left by the person, the brightness dims slowly to a smaller value or switches off completely.

The individual parameters of the desired profile, such as brightness values or delay times, can be adjusted flexibly and individually.

### 6.7 Constant Light Output (CLO)

With this function the light output of the LED module can be kept equal over the lifetime.

The light output of an LED module reduces over the course of its lifetime.

The Constant Light Output (CLO) function compensates for this natural decline by constantly increasing the output current of the LED driver throughout its lifetime.

CLO shall be achieved by limitation of the LED current at the commissioning of the LED driver and providing a linear interpolation of the current over the time, depending on the data points given by the user.

## 6.8 DC operation

In emergency light systems with a central battery supply the DC recognition function uses the input voltage to detect if emergency mode is present. The LED driver then automatically switches to DC mode and dims the light to the defined DC level.

Without DC recognition different and more complex solutions would have to be applied in order to detect emergency mode.

DC recognition is integrated in the device as standard.

No additional commissioning is necessary for activation.

This is a safety-relevant parameter.

The setting is relevant for the dimensioning of the central battery system.

The LED driver is designed to operate on DC voltage and pulsed DC voltage. For a reliable operation, make sure that also in DC emergency operation the LED driver is run within the specified conditions as stated in chapter "4.1 operating window".

Light output level in DC operation: programmable 1 – 100 %  
(factory default = 15 %, EOF<sub>i</sub> = 0.13).

The voltage-dependent input current of Driver incl. LED module is depending on the used load.

The voltage-dependent no-load current of Driver (without or defect LED module and DALI bus power supply deactivated) is for:

AC: < 16 mA

DC: < 2.5 mA

In DC operation dimming mode can be activated.

If Dimming on DC is activated the requirements of the DC recognition function are ignored.

Even if DC is detected, the LED driver continues to behave as in AC mode

- The present dimming level is retained
- An emergency light level defined for the DC recognition function (DC level) is ignored
- Control signals via DALI continue to be executed

If Dimming on DC is activated then emergency mode is not recognised. The device no longer automatically switches to the emergency light level.

## 6.9 Enhanced power on level (ePOL)

The Enhanced Power On Level parameter defines the power level that is set automatically when power is restored after a power failure.

The Enhanced Power On Level can be set to a fixed value (0 – 100 %) or can recall the memory value.

The memory value is the last value the LED driver was set to before the power failure.

This value applies not only in DALI device operating mode, but also in the device operating mode switchDIM.

## 6.10 DALI default parameters

In order for all luminaires to react the same for each operation (switching, dimming, scene recall ...), these values must be set the same.

These DALI standard parameters are supported by every DALI-2 device.

## 6.11 Scenes and groups

Each device can be a member of up to 16 groups.

Also, 16 different scene values can be stored in each device.

## 6.12 Integrated DALI bus power supply

This function complies to DiiA specification DALI Part 250 - Integrated bus power supply.

The output power of the integrated DALI Bus Power Supply (pDALI) has an output current of 50 mA (max. 62.5 mA).

It is activated by factory default.

Sensors and also external drivers could be directly connected to this power supply. The DALI power supply could be deactivated via software.

Power supplies can be combined up to 250 mA max in total.

This maximum must not exceed. The polarity has to be considered.

If the DALI power supply is activated, the driver must not be integrated into an existing, already with 250 mA powered DALI network.

DALI bus power supply has to be deactivated when using switchDIM or corridorFUNCTION.

Otherwise it could be damaged.

## 6.13 fade2zero

When the Driver is switched off, fade2zero allows a smooth dimming down to almost zero.

Activate the fade2zero function when programming with companionSUITE and set a DALI fade time. fade2zero only works if the minimum dimming level of the Driver is the default value.

The device then dims to far below the limit of its working window (dimming range).

This function is deactivated by default.

## 6.14 Power-up fading

The power-up function offers the opportunity to modify the on behavior. The time for fading on can be adjusted in a range of 0.2 to 16 seconds. According to this value, the device dims from 0 % up to the power-on level. By factory default no fading time is set (= 0 seconds).

## 6.15 Dimming curve

DALI:  
The desired dimming behaviour is selected via two different dimming curves (logarithmic or linear).  
The default setting of the dimming behaviour is logarithmic.

## 7. Protective features

### 7.1 Intelligent temperature guard (ITG)

The Intelligent temperature guard (ITG) function provides effective protection against thermal overloads by slowly reducing the output if a defined internal temperature is exceeded.  
The reduction of overtemperatures takes place in small steps every two minutes. As soon as the temperature drops again, the output power is gradually increased every 10 minutes.  
On DC operation this function is deactivated to fulfill emergency requirements.

### 7.2 Intelligent Voltage Guard (IVG)

The Intelligent Voltage Guard (IVG) function warns of possible damage due to overvoltage or undervoltage.  
The mains voltage is constantly monitored and if necessary appropriate responses are made:

- If the mains voltage is too low (< 70 V), the LED driver is switched off.
- At a mains voltage between 70 and 140 V, the LED driver switches off and on again on a non-cyclic basis.
- In case of an overvoltage (> 318 V), the LED driver sends feedback via DALI.

### 7.3 Short-circuit behaviour

In case of a short-circuit at the LED output the LED output is switched off. After restart of the LED driver the output will be activated again. The restart can either be done via mains reset or via interface (DALI, DSI, switchDIM, ready2mains)

### 7.4 No-load operation

The LED driver will not be damaged in no-load operation. The output will be deactivated and is therefore free of voltage. If a LED load is connected the device has to be restarted before the output will be activated again.

## 7.5 Overload protection

If the maximum load is exceeded by a defined internal limit, the LED driver turns off the LED output. After restart of the LED driver the output will be activated again.

The restart can either be done via mains reset or via interface (DALI, DSI, switchDIM, ready2mains).

## 7.6 Insulation between terminals

Insulation	Mains	PE	LED	DALI
Mains	–	basic	basic	basic
PE	basic	–	basic	basic
LED	basic	basic	–	basic
DALI	basic	basic	basic	–

basic ... represents basic insulation.

## 8. Miscellaneous

### 8.1 Insulation and electric strength testing of luminaires

Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative only!) or ENEC 303-Annex A, each luminaire should be submitted to an insulation test with 500 V<sub>DC</sub> for 1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal.  
The insulation resistance must be at least 2 MΩ.

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 V<sub>AC</sub> (or 1.414 x 1500 V<sub>DC</sub>). To avoid damage to the electronic devices this test must not be conducted.

### 8.2 Conditions of use and storage

Humidity: 5 % up to max. 85 %, not condensed (max. 56 days/year at 85 %)

Storage temperature: -40 °C up to max. +80 °C

The devices have to be acclimatised to the specified temperature range (ta) before they can be operated.

The LED driver is declared as inbuilt LED controlgear, meaning it is intended to be used within a luminaire enclosure.

If the product is used outside a luminaire, the installation must provide suitable protection for people and environment (e.g. in illuminated ceilings).

### 8.3 Maximum number of switching cycles

All LED driver are tested with 50,000 switching cycles.  
The actually achieved number of switching cycles is significantly higher.

### 8.4 Additional information

Additional technical information at [www.tridonic.com](http://www.tridonic.com) → Technical Data

Lifetime declarations are informative and represent no warranty claim.  
No warranty if device was opened.
